During my scientific career I have worked in the field of incompressible flow, both in experimental (PDA and PIV) and numerical CFD. I have worked mainly in the field of atomization (diesel sprays), ventilation, turbomachinery and cardiovascular flows. In the field of atomization, we developed an experimental methodology to study diesel jets by imaging. In the field of ventilation, I have worked experimentally and numerically in the ventilation of singular enclosures (mines, operating rooms, ...). In the field of turbomachines, a turbine has been designed for OWC plants that extract energy from waves. Finally, since 2005 I have been working on in vitro and in silico simulation of biological flows, in particular respiratory flow, and cardiovascular flows, such as flow in the nasal cavity, in bifurcations of coronary arteries, and in the atrium.
